Section 1 Introduction

1.1 Purpose

This Technical Data notebook (TDN) has been prepared for a Letter of Map Revision (LOMR) application for a portion of the Trails End Wash (TRA) located in Pima County, Arizona. The objective of the TDN and LOMR submission is to provide regulatory discharge rates and floodplain limits along the Trails End Wash using better topographic, hydrologic, and hydraulic data.

This TDN was prepared in accordance with the “Instructions for Organizing and Submitting Technical Documentation for Flood Studies” prepared by the Arizona Department of Water Resources, Flood Mitigation Section (Arizona State Standard, SSA 1-97) and FEMA Guideline. FEMA LOMR forms are included in this TDN.

1.2 Project Authority

The State of Arizona has delegated the responsibility to each county flood control district to adopt floodplain regulations designed to promote the public health, safety and general welfare of its citizenry as provided under the Arizona Revised Statutes, Title 48, Chapter 21, Article 1, Sections 48-3601 through 3627. More specifically, A.R.S. 3609 directs county flood control districts to adopt floodplain regulations that:

A. Regulate all development of land, construction of residential, commercial or industrial structures or uses of any kind which may divert, retard or obstruct flood water and threaten public health or safety or the general welfare; and
B. Establish minimum flood protection elevations and flood damage prevention requirements for uses, structures and facilities which are vulnerable to flood damage; and
C. Comply with state and local land use plans and ordinances, if any.

In conformance with A.R.S. 3609, this ordinance provides for protection of the public health safety and welfare by regulation of flood and erosion hazard areas to control flood hazards and prevent repetitive loss from flood damage.

D. The flood hazard areas of Pima County are subject to periodic inundation which may result in loss of life and property, create health and safety hazards, disrupt commerce and governmental services, require extraordinary public expenditures for flood protection and relief, and impair the tax base, all of which adversely affect the public health, safety, and general welfare.
E. These flood losses are caused by the cumulative effect of obstructions in areas of special flood hazards which increase flood heights, flow velocities, and cause flood and erosion damage. Uses that are inadequately flood-proofed, elevated, or otherwise protected from flood damage, also contribute to the flood loss. (Ord. 2005 FC-2 § 2 (part), 2005).
Section 16 of the Pima County Ordinance describes the provisions for floodplain regulation in Pima County.

This study has been prepared by the Pima County Regional Flood Control District (RFCD):

Pima County Regional Flood Control District
97 East Congress, Tucson, AZ 85701

The project was prepared by:

Dave Stewart, EIT, Civil Engineering Assistant.
Pima County Regional Flood Control District

1.3 Project Location

The study reach of the Trails End Wash (TRA) is located within a Federal Emergency Management Agency (FEMA)-designated “Zone A” flood-hazard area, as depicted on FIRM Map Panel Numbers 04019C1618K and 04019C1619K (February 8, 1999). The objective of the TDN and LOMR submission is to provide regulatory discharge rates and floodplain limits along the Trails End Wash using better topographic, hydrologic, and hydraulic data.

The study reach of the Trails End Wash is located primarily west of N. Silverbell Rd. and extends from Section 20 of Township 13 South, Range 13 East into Section 29 of Township 13 South, Range 13 East, in Pima County, Arizona.

1.4 Hydrologic and Hydraulic Methods

The hydrologic analysis was performed to determine proposed regulatory discharge rates at concentration points along the Trails End Wash using the U.S. Army Corps of Engineers Hydrologic Modeling System, HEC-HMS. The proposed regulatory discharges are flow rates that have a 1-percent chance of being equaled or exceeded each year (“100-year” discharge rates). Hydraulic analysis was performed to delineate floodplain limits along the study reach of the Trails End Wash using the Hydrologic Engineering Center’s River Analysis System (HEC-RAS).

No duplicate effective model is being provided because the area of the proposed map revision represents a complete replacement of the Trails End Wash existing model based on better topographical data and revised hydrology. The revised hydrology is based on the newer rainfall values from NOAA Atlas 14.
1.4 Acknowledgments
This study relied on assistance of RFCD staff, who were integral to the development of the models and maps.

1.5 Study Results
The regulatory discharges were calculated for floodplain mapping at three concentration points along the Trails End Wash (TRA A, B, and C). The 100-yr discharge of the Trails End Wash at N. Silverbell Rd. (TRA A) was found to be 2546.0 cfs with a drainage area of 2.84 mi$^2$.

2.1.4 Reach Description

The study reach of the Trails End Wash (TRA) is located within a Federal Emergency Management Agency (FEMA)-designated “Zone A” flood-hazard area, as depicted on FIRM Map Panel Numbers 04019C1618K and 04019C1619K (February 8, 1999). The study reach of the TRA is located primarily west of N. Silverbell Rd. and extends from Section 20 of Township 13 South, Range 13 East into Section 29 of Township 13 South, Range 13 East, in Pima County, Arizona.

The study reaches of the Trails End Wash contain coarse sand and cobble beds. Small shrubs and trees grow in some areas of the channel bed, and desert brush dominates the overbanks.
2.1.5 USGS Quad Sheets

Not available for this study.

2.1.6 Unique Conditions and Problems

There were no unique conditions or problems.

2.1.7 Coordination of Peak Discharges

The 100-year regulatory discharge rates at the concentration points along the study reach were computed using HEC-HMS, assuming no base flow in the watersheds and no transmission loss within the reaches. All reaches were modeled with HEC-RAS. The discharge rates were acceptable per Suzanne Shields, Director of the Pima County Regional Flood Control District and Andrew Dinauer, Engineering Administrator of the City of Tucson.

2.2 FEMA Forms

The FEMA MT-2 forms are included in Appendix B at the end of this TDN.
Section 3 Survey and Mapping Information

3.1 Field Survey Information

3.2 Mapping

The topographic data for the hydrology was obtained using 2008 Pima Associations of Governments (PAG) Light Detection and Ranging (LiDAR) data in Geo-RAS and ArcGIS. A raster was created from the 2008 LiDAR data with 5’ cells and used with Geo-RAS.

For the hydraulic analysis, the triangular irregular network (TIN) developed by HDR in the Silverbell Road, Grant Road to Ina Road Design Concept Report (2009) was used. The TIN was developed from 2005 Lidar (Appendix C) and supplemented with field survey methods that provide equal or better precision and accuracy to the Lidar data.

The following data was used in this TDN;
- The aerial photo: 2008 PAG aerial photo
- Projection: UTM, Zone 12
- Units: International feet
- The contour interval of the topographic map is 5 feet.

Section 4 Hydrology

4.1 Method Description

The 100-year peak discharges for the Trails End Wash were modeled using the U.S. Army Corps of Engineers Computer Hydrologic Modeling System, (HEC-HMS) version 3.2. The Trails End Wash basin upstream of N. Silverbell Rd. was split into eight sub-basins.

The HEC-HMS model requires parameters for rainfall, topography, soil, vegetation, and channel characteristics to determine runoff volume and peak discharge. Those parameters were determined according to the Pima County Regional Flood Control District Technical Policy 018 (Tech-018). Tech-018 is included in Appendix A. The HEC-HMS model is included in Appendix D.

4.2 Parameter Estimation

4.2.1 Drainage Area
The topographic data was obtained from a 5-ft cell raster created from 2008 PAG LiDAR data. ArcGIS was used to delineate watersheds from the raster and determine the drainage areas of each sub-basin. The composite watershed map is included in Exhibit A.

4.2.2 Watershed Work Map

Eight sub-basins were delineated for the Trails End Wash basin. The 100-year peak discharge was calculated for three concentration points (CP A, B, C) and used in the HEC-RAS hydraulic analysis for the floodplain maps (Exhibit A).

4.2.3 Gage Data

No gage data were used in this TDN.

4.2.4 Statistical Parameters

No data record was available for the Trails End Wash and therefore no Bulletin 17B analysis was used for this TDN.

4.2.5 Precipitation

According to Tech-018, the design storm should be used that produces the higher discharge between the 100-yr 3-hour SCS Type II distribution and the 100-yr 24-hr SCS Type I distribution. The 100-yr 3-hour SCS Type II distribution was found to produce the higher discharge on the Trails End Wash.

NOAA Atlas 14, upper 90% confidence interval precipitation frequency estimate values (NOAA 14 rainfall) were used to determine 3-hour and 24-hour point rainfall depths for the watershed. The point rainfall depth for the 3-hour storm was obtained for the coordinates of the watershed centroid (Latitude 32.2506°, Longitude -111.0607°). An areal reduction factor was applied to watersheds larger than 1 square mile as noted in Tech-018.

4.2.6 Physical Parameters

The physical parameters for the sub-basins and reaches of the HEC-HMS model are summarized in Tables 1 and 2. As mentioned in 4.1, all the methods and parameters were determined based on Tech-018. Table 1 summarizes the method used for the HEC-HMS analysis.
Table 1 Methods used for the HEC-HMS analysis

</table>

The SCS Curve Number (CN) method was utilized as a rainfall loss method in the HEC-HMS model. The CN was determined using the Curve Number tables and Hydrologic Soils Group maps associated with the PC Hydro User Guide (Arroyo Engineering, 2007). The CN was not adjusted for rainfall intensity or antecedent moisture conditions.

The SCS Unit Hydrograph method was used as a transform method. Impervious cover was determined using 2008 PAG aerial photographs. The combination of the kinematic wave time of concentration method and the U.S. Natural Resources Conservation Service (NRCS) segmented Time of Concentration (Tc) calculation (USDA-NRCS, 1986) was used to determine Tc, based on the recommendation on Tech-018. The Tc was calculated by summing the travel time for sheet flow, shallow concentrated flow and channel flow. The Tc for sheet flow was estimated using the kinematic wave equation. Manning’s roughness coefficient for sheet flow was obtained using Table 3-1 in Technical Release 55, Urban Hydrology for Small Watersheds (USDA-NRCS, 1986). The velocity for channel was calculated using Manning’s equation. The detail of the Tc calculation is included in Appendix D.

Runoff from sub-basins was routed using the Modified-Puls method. A storage discharge table for the channel routing was developed using the cross sections and slopes derived from HEC-HMS. The number of sub-reaches was calculated using the following method:
Figure 4.2
Soil Classification Map
Trails End Wash

The information depicted on this display is the result of digital analyses performed on a variety of databases provided and maintained by several governmental agencies. The accuracy of the information presented is limited to the collective accuracy of these databases on the date of the analysis. The Pima County Regional Flood Control Department makes no claims regarding the accuracy of the information depicted herein.

This product is subject to the Department of Transportation Technical Services Division's Use Restriction Agreement.
\[ V_w = 1.5 \cdot V_{ave} \] \hspace{1cm} \text{eq. 1}

\[ K = \frac{L}{V_w} \] \hspace{1cm} \text{eq. 2}

Therefore,

\[ N = \frac{K}{\Delta t} \] \hspace{1cm} \text{eq. 3}

where \( V_{ave} \) is the average flow velocity, \( L \) is the reach length, \( V_w \) is the velocity of the flood wave (a conversion factor of 1.5 is used for natural channels), \( K \) is the hydrograph travel time, \( \Delta t \) is the time interval for computations in the model, and \( N \) is the number of steps in the reach routing. Eq. 4 was obtained from eq. 1, 2, and 3. The detail of the calculation of the number of sub-reach is included in Appendix D.

### 4.3 Problems Encountered During the Study

#### 4.3.1 Special Problems and Solutions

There were no problems with the hydrologic modeling.

#### 4.3.2 Modeling Warning and Error Messages

The time interval of the rainfall data used in this study is 5 minutes, while the simulation time interval is 1 minute. The HEC-HMS model interpolated the 5-minute time interval of the rainfall data to 1-minute time interval.

The following warnings were produced in the HEC-HMS;

- The “3-hr SCS Type II” gage with data interval of 5 minutes was interpolated to a simulation time interval of 1 minute.

### 4.4 Calibration

No calibration was conducted in this study.

### 4.5 Final Results

#### 4.5.1 Hydrologic Analysis Results

The 100-year peak discharges at the concentration points along the Trails End Wash were determined using HEC-HMS. The results are summarized in Tables 3 and 4.
refers to the junction in the HEC-HMS model that receives flow from only the reach included in the hydraulic analysis and the TRA B sub-basin. The junction labeled CP B is the same location as CP B 2 but includes all incoming reaches at concentration point B and the TRA B sub-basin. The discharge at CP B 2 was used for the hydraulic analysis of the study reach above concentration point B.

Section 5 Hydraulics

5.1 Method Description

The hydraulic modeling for the Trails End Wash was performed using HEC-RAS, Version 4.0, HEC-GeoRAS, Version 4.1.1, and ArcGIS, Version 9.2.

The topographic data was obtained using a triangular irregular network (TIN) developed by HDR in the Silverbell Road, Grant Road to Ina Road Design Concept Report (2009) (Appendix C). The locations of the stream centerlines were determined using ArcGIS with the contour lines from the topographic data and 2008 PAG aerial photos.

The physical attributes of the wash were digitized in ArcGIS using the HEC-GeoRAS extension and then exported to HEC-RAS to create geospatially referenced geometric data (cross sections, reach lengths). Other parameters for the steady-state analysis, such as the Manning’s n-values, obstructions, and ineffective flow areas were manually entered into HEC-RAS. The hydraulic data obtained from HEC-RAS were exported to ArcGIS to delineate the floodplain in the study area. The downstream boundary condition for the reach was assumed to be normal depth with a slope estimated as the bed slope between the two farthest downstream cross sections.

The hydraulic analysis was performed in the area currently mapped as FEMA Zone A. A steady flow analysis was performed to determine 100-year water surface elevations in the study area by using HEC-RAS. The HEC-RAS data and shape files (contour lines, flow path, cross section lines, study watersheds, concentration points, sub-watersheds, hydrologic soil groups, proposed floodplain limit) used in the analysis are included in Appendix D with an attached CD.

5.2 Work Study Maps

The work study map for the Trails End Wash is included in Exhibit B.

5.3 Parameter Estimation

5.3.1 Roughness Coefficients

Manning’s n values were determined in the field and using 2008 PAG aerial photo based on USGS publications for Manning’s n values in southern Arizona (Phillips and Tadayon, 2006). A Manning’s n value of 0.045 was assigned for the channel based on the sand and cobble bed material with dense vegetation in some areas, and a value of 0.060 was assigned for the overbanks based on the desert brush (Figures 5.1 and 5.2).
Figure 5.1. Trails End Wash Photo 1. A location of the Trails End Wash containing cobbles and dense vegetation at Lloyd Bush Rd., farther upstream in the watershed than Silverbell Rd.

Figure 5.2. Trails End Wash Photo 2. A location of the Trails End Wash with a primarily sand channel and scattered vegetation immediately downstream of Silverbell Rd.
5.3.2 Expansion and Contraction Coefficients

The Trails End Wash is assumed to have relatively gradual transitions, and the default values for the expansion and contraction coefficient of 0.30 and 0.10 were used respectively.

5.4 Cross-Section Description

Cross-section locations were determined primarily based on the channel topography from the TIN and 2008 PAG LiDAR data. Cross sections were placed at a spacing of approximately 100 ft. The cross-section lines were drawn to be perpendicular to flow paths in ArcGIS.

5.5 Modeling Consideration

5.5.1 Hydraulic Jump and Drop Analysis
No hydraulic jumps or hydraulic drops were modeled in this study.

5.5.2 Bridges and Culverts
There are no bridges located in the floodplain study reach of the Trails End Wash.

5.5.3 Levees and Dikes
There are no levees or dikes located within the study limit.

5.5.4 Island and Flow Splits
No islands or split flows were modeled in the study.

5.5.5 Ineffective Flow Areas

Ineffective flow option was modeled in situations where:
- The floodplain areas are not hydraulically connected
- There is a contraction or expansion of the effective flow area.
5.6 Floodway Modeling

No floodway modeling was performed in this study.

5.7 Problems Encountered

5.7.1 Special Problems and Solutions

At three locations along the Trails End Wash near Silverbell Rd., the 100-yr discharge was not contained in the channel and a discharge could leave the channel without returning to the main flow path. As a result, River Stations 2093, 1030, and 684 have “hanging” cross sections. These locations were modeled in HEC-RAS using lateral structures along the overbank of the channel. The discharge leaving the channel was determined using the optimization feature in HEC-RAS for the lateral structures. The “break out” flow paths were modeled as separate reaches of the Trails End Wash using the discharge determined from the optimization feature. Two of these “break out” flow paths (River Station 2200 “Breakout 1,” and River Station 830 “Breakout 2”) are proposed as a Shallow 100 yr Flooding Zone where flow depth is less than one foot.

The third location of a break out leads to a depression in the floodplain of the Santa Cruz (River Station 1430, “Overbank Ponding”). The stage-storage relationship for this depression was determined in a GIS using the 2-ft contour lines and the area measurement tool. The volume of the depression was calculated by assuming a conical volume change for increases in elevation and area (Table 6). The volume of flow leaving the channel was found by calculating the area of the top of the hydrograph that was determined to leave the channel by the lateral structure optimization feature. The peak discharge in the channel at Silverbell Rd. was determined as 2546.04 cfs, and the peak discharge leaving the channel into the depression was found as 20.28 cfs. The volume leaving the channel was calculated as 0.079 ac-ft by finding the area of the hydrograph with discharge exceeding 2525.76 cfs, or 20.28 cfs lower than the maximum discharge. The depth of the flow stored in the depression was determined as 1.24 ft from the calculated volume and the stage-storage relationship. The depression was found to contain the volume of flow leaving the channel and the depression was added to the floodplain map as a proposed Zone A.

Table 6. Stage-storage relationship for overbank ponding located at River Station 1430.

</tbody>
</table>
River Station 495 is a “hanging” cross section with an ineffective area that extends over a wastewater treatment pond near the Santa Cruz river and no right bank extending above the water surface elevation; however, the cross section is within the current FEMA Zone A for the Santa Cruz River and should not affect the proposed Zone A for the Trails End Wash.

5.7.2 Model Warnings and Errors

The FEMA guidelines require hydraulic models to simulate subcritical flow conditions. The HEC-RAS modeling produced warnings at some cross sections stating that:

- The energy equation could not be balanced within the specified number of iterations
- The energy loss was greater than 1.0 ft between cross sections
- The conveyance ratio is less than 0.7 or greater than 1.4
- Multiple critical depths were found
- Divided flow was computed and
- The program defaulted to critical depth when the water surface was calculated below critical depth
- Cross sections end points were extended vertically for the computed cross section

A summary of errors is available in Appendix E.

5.8 Calibration

The model was not calibrated in this study.

5.9 Final Results

5.9.1 Hydraulic Analysis Results

The HEC-RAS modeling results are summarized in Appendix E.

5.9.2 Verification of Results

The floodplain limit produced in this LOMR study was compared to the existing FEMA floodplain limit. The proposed limits are similar to the existing FEMA floodplain limit, but provide additional detail. This similarity to the existing FEMA floodplain limit suggests that the results are reasonable.
Section 6 Erosion and Sediment Transport

No erosion or sediment transport analysis was conducted in this study.

Section 7 Draft FIS Report Data

7.1 Summary of Discharges
The peak discharge at Silverbell Rd. (CP A) was determined as 2546 cfs for the drainage area of 2.84 square miles. The discharges along the flow path upstream of Silverbell Rd., CP B 2 and CP C, were found to be 1749.5 and 1645.7 respectively with drainage areas of 1.98 and 1.46 square miles.

7.2 Floodway Data
Not applicable.

7.3 Annotated Flood Insurance Rate Map
An annotated Flood Insurance Rate Map (FIRM) is included in Exhibit 2.

7.4 Flood Profiles
Flood profiles are included in Appendix E.

A 2. Referenced Documents

Appendix B General Documentation and Correspondence
A. REQUESTED RESPONSE FROM DHS-FEMA

This request is for a (check one):

☐ CLOMR: A letter from DHS-FEMA commenting on whether a proposed project, if built as proposed, would justify a map revision, or proposed hydrology changes (See 44 CFR Ch. 1, Parts 60, 65 & 72).

☒ LOMR: A letter from DHS-FEMA officially revising the current NFIP map to show the changes to floodplains, regulatory floodway or flood elevations. (See 44 CFR Ch. 1, Parts 60, 65 & 72)

B. OVERVIEW

1. The NFIP map panel(s) affected for all impacted communities is (are):

2. a. Flooding Source: Trails End Wash

b. Types of Flooding: ☒ Riverine ☐ Coastal ☐ Shallow Flooding (e.g., Zones AO and AH)

☐ Alluvial fan ☐ Lakes ☐ Other (Attach Description)

3. Project Name/Identifier: Trails End Wash

5. Basis for Request and Type of Revision:

a. The basis for this revision request is (check all that apply)

☐ Physical Change ☒ Improved Methodology/Data ☐ Regulatory Floodway Revision ☐ Base Map Changes

☐ Coastal Analysis ☐ Hydraulic Analysis ☐ Hydrologic Analysis ☐ Corrections

☐ Weir-Dam Changes ☐ Levee Certification ☐ Alluvial Fan Analysis ☐ Natural Changes

☐ New Topographic Data ☐ Other (Attach Description)

Note: A photograph and narrative description of the area of concern is not required, but is very helpful during review.

b. The area of revision encompasses the following structures (check all that apply)

Structures: ☐ Channelization ☐ Levee/Floodwall ☐ Bridge/Culvert

☐ Dam ☐ Fill ☐ Other (Attach Description)
C. REVIEW FEE

Has the review fee for the appropriate request category been included?  
☐ Yes  Fee amount: $____  
☒ No, Attach Explanation

D. SIGNATURE

All documents submitted in support of this request are correct to the best of my knowledge. I understand that any false statement may be punishable by fine or imprisonment under Title 18 of the United States Code, Section 1001.

Signature of Requester (required):  
Date: 5/5/2010

As the community official responsible for floodplain management, I hereby acknowledge that we have received and reviewed this Letter of Map Revision (LOMR) or conditional LOMR request. Based upon the community's review, we find the completed or proposed project meets or is designed to meet all of the community floodplain management requirements, including the requirement that no fill be placed in the regulatory floodway, and that all necessary Federal, State, and local permits have been, or in the case of a conditional LOMR, will be obtained. In addition, we have determined that the land and any existing or proposed structures to be removed from the SFHA are or will be reasonably safe from flooding as defined in 44CFR 65.2(c), and that we have available upon request by FEMA, all analyses and documentation used to make this determination.

CERTIFICATION BY REGISTERED PROFESSIONAL ENGINEER AND/OR LAND SURVEYOR

This certification is to be signed and sealed by a licensed land surveyor, registered professional engineer, or architect authorized by law to certify elevation information data, hydrologic and hydraulic analysis, and any other supporting information as per NFIP regulations paragraph 65.2(b) and as described in the MT-2 Forms Instructions. All documents submitted in support of this request are correct to the best of my knowledge. I understand that any false statement may be punishable by fine or imprisonment under Title 18 of the United States Code, Section 1001.

Certifier's Name: Howard Evan Canfield  
License No.: 41917  
Expiration Date: 3/31/2011

Company Name: Pima County Regional Flood Control  
Telephone No.: 520-243-1836  
Fax No.:  
Signature:  
Date: 5/5/10

Ensure the forms that are appropriate to your revision request are included in your submittal.

Form Name and (Number)  
☐ Riverine Hydrology and Hydraulics Form (Form 2)  
☐ Riverine Structures Form (Form 3)  
☐ Coastal Analysis Form (Form 4)  
☐ Coastal Structures Form (Form 5)  
☐ Alluvial Fan Flooding Form (Form 6)  

Required if ...

☐ New or revised discharges or water-surface elevations  
☐ Channel is modified, addition/revision of bridge/culverts, addition/revision of levee/floodwall, addition/revision of dam  
☐ New or revised coastal elevations  
☐ Addition/revision of coastal structure  
☐ Flood control measures on alluvial fans  

Seal (Optional)
A. REQUESTED RESPONSE FROM DHS-FEMA

This request is for a (check one):

☐ CLOMR: A letter from DHS-FEMA commenting on whether a proposed project, if built as proposed, would justify a map revision, or proposed hydrology changes (See 44 CFR Ch. 1, Parts 60, 65 & 72).

☒ LOMR: A letter from DHS-FEMA officially revising the current NFIP map to show the changes to floodplains, regulatory floodway or flood elevations. (See 44 CFR Ch. 1, Parts 60, 65 & 72)

- ☐ Coastal Structures Form (Form 5)  
  Addition/revision of coastal structure
- ☐ Alluvial Fan Flooding Form (Form 6)  
  Flood control measures on alluvial fans
Flooding Source: Trails End Wash  
Note: Fill out one form for each flooding source studied

A. HYDROLOGY

1. Reason for New Hydrologic Analysis (check all that apply)
   - □ Not revised (skip to section B)
   - □ No existing analysis
   - □ Improved data
   - □ Alternative methodology
   - □ Proposed Conditions (CLOMR)
   - □ Changed physical condition of watershed

2. Comparison of Representative 1%-Annual-Chance Discharges

<table>
<thead>
<tr>
<th>Location</th>
<th>Drainage Area ( Sq. Mi. )</th>
<th>Effective/FIS (cfs)</th>
<th>Revised (cfs)</th>
</tr>
</thead>
<tbody>
<tr>

<td>N/A</td>
<td>2546.0</td>
</tr>
<tr>
<td>Near N. Grannen Rd.</td>
<td>2.72</td>
<td>N/A</td>
<td>2543.5</td>
</tr>
<tr>
<td>Near Wilma Dell Rd.</td>
<td>1.46</td>
<td>N/A</td>
<td>1645.7</td>
</tr>
</tbody>
</table>

3. Methodology for New Hydrologic Analysis (check all that apply)
   - □ Statistical Analysis of Gage Records
   - □ Precipitation/Runoff Model HEC-HMS
   - □ Regional Regression Equations
   - □ Other (please attach description)

Please enclose all relevant models in digital format, maps, computations (including computation of parameters) and documentation to support the new analysis.

4. Review/Approval of Analysis

If your community requires a regional, state, or federal agency to review the hydrologic analysis, please attach evidence of approval/review.

5. Impacts of Sediment Transport on Hydrology

   Was sediment transport considered? □ Yes □ No  If yes, then fill out Section F (Sediment Transport) of Form 3. If No, then attach your explanation for why sediment transport was not considered.

B. HYDRAULICS

1. Reach to be Revised

<table>
<thead>
<tr>
<th>Description</th>
<th>Cross Section</th>
<th>Water-Surface Elevations (ft.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Downstream Limit</td>
<td>Confluence with the Santa Cruz River</td>

<td>Goret Rd.</td>
<td>St# 7662.95</td>
</tr>
</tbody>
</table>

2. Hydraulic Method/Model Used

   HEC-RAS
B. HYDRAULICS (CONTINUED)

DHS-FEMA has developed two review programs, CHECK-2 and CHECK-RAS, to aid in the review of HEC-2 and HEC-RAS hydraulic models, respectively. These review programs may help verify that the hydraulic estimates and assumptions in the model data are in accordance with NFIP requirements, and that the data are comparable with the assumptions and limitations of HEC-2/HEC-RAS. CHECK-2 and CHECK-RAS identify areas of potential error or concern. These tools do not replace engineering judgment. CHECK-2 and CHECK-RAS can be downloaded from http://www.fema.gov/plan/prevent/fhm/frm_soft.shtm. We recommend that you review your HEC-2 and HEC-RAS models with CHECK-2 and CHECK-RAS. Review of your submittal and resolution of valid modeling discrepancies may result in reduced review time.

C. MAPPING REQUIREMENTS

A certified topographic map must be submitted showing the following information (where applicable): the boundaries of the effective, existing, and proposed conditions 1%-annual-chance floodplain (for approximate Zone A revisions) or the boundaries of the 1%- and 0.2%-annual-chance floodplains and regulatory floodway (for detailed Zone AE, AO, and AH revisions); location and alignment of all cross sections with stationing control indicated; stream, road, and other alignments (e.g., dams, levees, etc.); current community easements and boundaries; boundaries of the requester's property; certification of a registered professional engineer registered in the subject State; location and description of reference marks; and the referenced vertical datum (NGVD, NAVD, etc.).

D. COMMON REGULATORY REQUIREMENTS*

1. For LOMR/CLOMR requests, do Base Flood Elevations (BFEs) increase?
   - Yes ☐ No ☑
   a. For CLOMR requests, if either of the following is true, please submit evidence of compliance with Section 65.12 of the NFIP regulations:
      - The proposed project encroaches upon a regulatory floodway and would result in increases above 0.00 foot.
      - The proposed project encroaches upon a SFHA with or without BFEs established and would result in increases above 1.00 foot.
   b. For LOMR requests, does this request require property owner notification and acceptance of BFE increases? ☑ No ☐
      If Yes, please attach proof of property owner notification and acceptance (if available). Elements of and examples of property owner notification can be found in the MT-2 Form 2 Instructions.

2. Does the request involve the placement or proposed placement of fill?
   - Yes ☐ No ☑
   If Yes, the community must be able to certify that the area to be removed from the special flood hazard area, to include any structures or proposed structures, meets all of the standards of the local floodplain ordinances, and is reasonably safe from flooding in accordance with the NFIP regulations set forth at 44 CFR 60.3(a)(3), 65.5(a)(4), and 65.6(a)(14). Please see the MT-2 instructions for more information.

3. For LOMR requests, is the regulatory floodway being revised?
   - Yes ☐ No ☑
   If Yes, attach evidence of regulatory floodway revision notification. As per Paragraph 65.7(b)(1) of the NFIP Regulations, notification is required for requests involving revisions to the regulatory floodway. (Not required for revisions to approximate 1%-annual-chance floodplains [studied Zone A designation] unless a regulatory floodway is being added. Elements and examples of regulatory floodway revision notification can be found in the MT-2 Form 2 Instructions.)

4. For LOMR/CLOMR requests, does this request have the potential to impact an endangered species?
   - Yes ☐ No ☑
   If Yes, please submit documentation to the community to show that you have complied with Sections 9 and 10 of the Endangered Species Act (ESA). Section 9 of the ESA prohibits anyone from “taking” or harming an endangered species. If an action might harm an endangered species, a permit is required from U.S. Fish and Wildlife Service or National Marine Fisheries Service under Section 10 of the ESA.
   For actions authorized, funded, or being carried out by Federal or State agencies, please submit documentation from the agency showing its compliance with Section 7(a)(2) of the ESA.

* Not inclusive of all applicable regulatory requirements. For details, see 44 CFR parts 60 and 65.

Re: Re: Acceptability of LiDAR

Dear Mr. Kennedy:

The Pima Association of Governments (PAG) has contracted with Sanborn to generate ortho rectified aerial photography and LiDAR. Figure 1 shows the extent of the LiDAR coverage for Pima County and the FIRM Special Flood Hazard Areas. The next version of Flood Insurance Rate Maps for Pima County will be converted to the North American Vertical Datum of 1988 (NAVD88). Attached to this letter you will find a draft letter from Sanborn indicating the vertical accuracy of the LiDAR meets FEMA’s Map Modernization requirements.

The Pima County Regional Flood Control District (District) requests that the documentation in the draft letter be examined by FEMA to verify the LiDAR and topography created from this data would meet FEMA’s vertical requirements for mapping to the NAVD88 Datum. If acceptable, the District will request PAG to have Sanborn seal the documentation so that it may be used in FEMA re-mapping processes. The District understands the digital maps generated from the LiDAR would need to be re-projected to FEMA’s UTM coordinate system for LOMR applications.

Please call me at 520-243-1800, should you have any questions with this request.

Sincerely,

R. “Terry” Hendricks, CFM, Chief Hydrologist
Planning and Development Division

RTH/ed

Cc: Steve Whitney, GIS Manager, Pima County Department of Transportation
    Kenneth Maits, Senior GIS Analyst, PC Regional Flood Control District
    Manny M. Rosas, GIS Administrator, Pima Association of Governments.

Re: FEMA Results for the PAG 2008 Ortho Project (Contract – 08-5951-01)

Dear Mr. Rosas,

Attached you will find the results of the FEMA checkpoints for PAG 2008 LiDAR data. Sanborn’s contracted Arizona State Registered Land-Surveyor, Greg Thompson, performed a review of the report and is in agreement with the results.

Background

To ensure the accuracy of the PAG 2008 LiDAR data, Sanborn was contracted to implement a project plan that included the integration of FEMA checkpoints as part of the QA/QC process. To support this initiative, Sanborn collected 69 checkpoints as part of the control survey effort. This meets the minimum standards for vertical accuracy testing and reporting as defined in FEMA’s map modernization requirements. FEMA recommends 20 checkpoints in each of the major land cover categories representative of floodplains being mapped; this normally requires a minimum of 60 checkpoints for at least three land cover categories. The three categories surveyed were:

1. Bare Earth and Low Grass
2. High Grass, Weeds, and Crops
3. Brush lands/low trees

Field data was acquired using GPS equipment and static surveying methods. Sanborn team surveyed all checkpoint following the procedures in NOAA Technical Memorandum NOS NGS-58, "Guidelines for Establishing GPS-Derived Ellipsoid Heights (Standards: 2 cm and 5 cm)" and use NGS' latest Geoid Model to compute NAVD88 orthometric heights accurate to 5-cm at the 95% confidence level. (The x and y coordinates of checkpoints will be accurate to 2-cm at the 95% confidence level.)

Final adjusted results were adjusted to Arizona State Plane Coordinates, Central Zone NAD83-92 (HAARN), NAVD88, in units of International Foot.

Testing Methodology
As stated in the Guidelines and Specifications for Flood Hazard Mapping Partners (April 2003), Section A.87.6.1, “The Root Mean Square Error (RMSE) is the square root of the average of the set of squared differences between dataset coordinate values and coordinate values from an independent source of higher accuracy for identical points…TINs (and DEMs derived therefrom) should normally have a maximum RMSE of 18.5 centimeters, equivalent to
2-foot contours, in flat terrain. The following are the results from the PAG 2008 Ortho Program.

Sanborn concludes that the overall RMSE of the LiDAR data is within PAG 2008 Ortho project requirements, as it meets the +/- 15.0 cm (0.492 foot) RMSE at 95% confidence for all three categories. RMSE is an indicator of overall accuracy of the product and is not used for individual point accuracy.

Please contact me at (719) 593-0093 extension 5645 or Jamie Young (General Manager – ext. 5602) if you have any question regarding the report.

Sincerely,

Andrew Lucero
Sanborn
Senior Project Manager
